ap_aging

Accounts-payable aging service: groups open invoices into days-past-due buckets, and lists unpaid invoices more than 30 days past due with their vendor's risk level.

Public functions (`ap_aging.__all__`):

- `aging_buckets(invoices, as_of)`: total open amount per days-past-due bucket.
- `overdue_with_risk(invoices, as_of, risk_by_vendor)`: unpaid invoices more than 30 days past due, with vendor risk,

most overdue first.

- `overdue_rows_to_json(rows)`: the overdue rows as CT-1 JSON for ap_portal (amounts as two-decimal strings).

See docs/ap_aging.md for inputs, outputs, rules and examples.

Run CI: `/usr/bin/python3 ci.py`
