task.db_changes: FEAT-ZD-48600

Database changes check for the Backend lane of FEAT-ZD-48600 (ZD-48600, "Show which overdue invoices belong to vendors that usually pay late"). This is step BE-03 Database changes.

Result: no database change is required, so none is outstanding. The prerequisite is met and BE-04 can start.

Field	Value	Source
Trace ID	FEAT-ZD-48600	record:brief
Step	BE-03 Database changes	record:brief
Owner / gate	Developer / automated checks, independent judge, sampled human evaluation	record:brief
Backend tasks in scope	TSK-05 (STORY-05) and TSK-06 (STORY-06), ap_aging	feat.tasks (section 1)
Inputs	feat.tasks (b0fd4d2), feat.design (722a98f)	record:brief
Repository checked	ap_aging	tool:repo-access; file:ap_aging/CLAUDE.md

1. What the design asks of storage

Check	Finding	Source
Storage, database or schema migration in scope?	No. The design lists "Storage, database, schema migration" as out of scope; data in scope is in-memory only (delay history, risk map, overdue rows) plus the CT-1 JSON string	feat.design (A1, Data row)
New technology or storage allowed?	No. DD-1: "No new repository, service, runtime, library or storage"; only the Python 3.9 standard library and Node.js 22 CommonJS	feat.design (A7, DD-1)
Do the new functions touch storage?	No. Every new function is pure and in-memory: no I/O, no network, no mutation of inputs	feat.design (A5, NF-10)
Would storage reopen the platform design?	Yes: "any storage or network call from the libraries" is a DES-01 re-trigger; the design triggers none	feat.design (A8)
New data shapes	The `paid_date` record key and the `'paid_date'` reject reason (ap_pipeline, DE lane), and the overdue row and CT-1 payload (ap_aging). All are Python dicts or a JSON string, not tables	feat.design (A1, B1.3, B3.3)

2. What the Backend tasks change

Task	Files in budget	Storage touched	Source
TSK-05	`src/ap_aging/aging.py`, `src/ap_aging/__init__.py`, new `tests/test_overdue.py`	None. `overdue_with_risk` takes invoices, `as_of` and `risk_by_vendor` as arguments and returns a list	feat.tasks (TSK-05); feat.design (B3.1, B3.2)

Task	Files in budget	Storage touched	Source
TSK-06	`src/ap_aging/aging.py`, `src/ap_aging/__init__.py`, `tests/test_overdue.py`	None. `overdue_rows_to_json` returns a string; "No transport layer (a transport would re-trigger DES-01)"	feat.tasks (TSK-06); feat.design (DD-3, B3.2)

Neither task lists a migration, schema, DDL file or database dependency in its "Depends on" row (feat.tasks, TSK-05 and TSK-06).

3. What the repository holds

Check	Finding	Source
Database or migrations in ap_aging	ap_aging has no database; no migrations exist or are required	tool:repo-access
Repository layout	Code in `src/ap_aging/`, tests in `tests/`; Python 3.9 with the standard library	file:ap_aging/CLAUDE.md
Existing module imports	`aging.py` imports only `datetime.date`, `decimal.Decimal` and `typing`; no database client	file:ap_aging/src/ap_aging/aging.py
Package entry point	`__init__.py` imports only `aging_buckets` from `.aging`; version `1.4.0`	file:ap_aging/src/ap_aging/__init__.py

4. Outcome

Item	Status
Required database changes for TSK-05 and TSK-06	None required
Database changes completed	Not applicable (nothing to apply)
DBA or infra team action	None needed
Stop-and-ask ("a required dependency or database change is missing")	Does not apply

5. Re-check triggers

Run BE-03 again if any of these change. Each one would also reopen the platform design (feat.design A8):

- A transport or service is added between ap_aging and ap_portal (TQ-3, DQ-1).
- Any library gains a storage or network call.
- The overdue list or vendor risk has to be persisted (no input asks for this).

6. Open questions

None new. Carried, not blocking this step: DQ-1 (which production component wires the stages and carries CT-1; feat.design D3).

[Tool result] [ap_aging] No database in this repository's architecture; no migrations required
