task.repo_access: FEAT-ZD-48600

Coding prerequisites for the Backend lane of FEAT-ZD-48600 (ZD-48600, "Show which overdue invoices belong to vendors that usually pay late"). This is BE-01 Checking the coding prerequisites (attempt 3). No gate: automated checks, the independent judge and sampled human evaluation.

Attempt 3 fixes the G2 refusals of attempts 1 and 2. Every statement now cites only the step's two contracted inputs (read with receipts through context_get), the step's repo-access tool view and this brief. No direct repository file is cited.

Field	Value	Source
Trace ID	FEAT-ZD-48600	record:brief
Step	BE-01 Checking the coding prerequisites (attempt 3)	record:brief
Inputs	feat.tasks (revision b0fd4d2, produced by DES-04); org.engineering_stack (revision a6b3e2a)	record:brief; feat.tasks; org.engineering_stack
Backend tasks in scope	TSK-05 (STORY-05) and TSK-06 (STORY-06), both in Backend / ap_aging	feat.tasks (section 1)
Access evidence	The step's repository-access tool view. This step may not run shell commands, so the agent ran no git command of its own	tool:repo-access

1. Repository availability and write access

Check	Result	Source
Repository required by the Backend tasks	ap_aging. TSK-05 and TSK-06 change `src/ap_aging/aging.py` and `src/ap_aging/__init__.py`, and add the new `tests/test_overdue.py`	feat.tasks (section 2 "Test files"; section 3 TSK-05, TSK-06 "Files in budget")
Repository available	**Yes.** ap_aging (Python 3.9, standard library) is available locally	tool:repo-access
Repository creation needed	**No.** The repository already exists, and TSK-05 and TSK-06 add to existing modules plus one new test file	tool:repo-access; feat.tasks (section 3, TSK-05, TSK-06)
Write access for the agent identity	**Yes.** The agent identity has write access, and git status is clean	tool:repo-access
Working branch	`feature/story`, created from `dev` at commit `5d2cbb9`	tool:repo-access
Branch model	Branches `main` (released) and `dev` (integration); feature branches per story (`feature/<story>`)	org.engineering_stack; feat.tasks (section 2)
Databricks or other workspace	**Not used.** ap_aging uses no Databricks or other workspace, and no repository uses Databricks or a database	tool:repo-access; org.engineering_stack

Outcome: the repository is available with write access. The Backend lane can start TSK-05 and then TSK-06 (TSK-06 depends on TSK-05) on `feature/story`.

2. Repository facts the coding steps rely on

Fact	Value	Source
Language and test framework	Python 3.9, unittest	org.engineering_stack
CI command	`/usr/bin/python3 ci.py`	org.engineering_stack
CI gate	Line coverage >= 90% and static checks that stand in for SonarQube	org.engineering_stack
CI bar for coding tasks	Compile, unit tests, coverage of at least 90% and static checks stay green. Python 3.9 syntax only; no `print`, `eval`, `exec` or bare `except`; lines at most 140 characters; every error branch tested	feat.tasks (section 2)
Current ap_aging version	`1.4.0`; TSK-05 owns the version step, and the lane confirms the next version	feat.tasks (section 2 "Version step")
Existing functions that must not change	`aging_buckets`, `days_past_due`, `bucket_for`, `BUCKETS`	feat.tasks (section 3, TSK-05 "Must not change")
Signature rule	Keep every existing signature; add new functions	feat.tasks (section 2)
Commit message rule	Messages start with the story ID (STORY-05 or STORY-06); the task ID may follow	org.engineering_stack; feat.tasks (section 2)

3. Observations (non-blocking)

ID	Observation	Interim handling	Source
RA-1	The branch is named `feature/story`. The convention is `feature/<story>`, and the Backend lane carries two stories (STORY-05, STORY-06)	Use `feature/story`, as provided, for both Backend tasks. Commit messages keep the story ID prefix for traceability	tool:repo-access; feat.tasks (section 1, section 2)
RA-2	The agent did not check remote push rights, because only the spine runs push and merge	Write access is taken from the tool view	tool:repo-access
RA-3	This step could not run CI, because it may not run shell commands, so the CI toolchain on `/usr/bin/python3` is not verified here	The first CI run in the coding steps confirms that the toolchain works	org.engineering_stack; tool:repo-access

4. Validation check

Check	Result	Source
Repository available	Pass	tool:repo-access
Write access	Pass	tool:repo-access
Repository creation	Not needed	tool:repo-access
Databricks / database access	Not applicable	tool:repo-access; org.engineering_stack
Blocking questions	None	—

[Tool result] [ap_aging] Branch feature/story at 5d2cbb9; write access confirmed
